Boundary Element Analysis: Theory & Programming

The BEM have some advantages over other numerical methods like finite element methods (FEM) or finite differences:

1. Only the boundary of the domain needs to be discretized. Especially in two dimensions where the boundary is just a curve this allows very simple data input and storage methods.
- 2.

Boundary Element Method in itself but rather an extension to the classical method which can be used in the many cases in which we have to deal with sources that cannot be transformed to the boundary by other means. In Part III, we present a new development in the field of symmetric formulations, the Hybrid Boundary Element Methods.
